    property : value;
} -->
</body>
</html>

```

## Theory Notes

### 1. CSS Selectors

- **Universal selector (\*)** → applies to all elements.
- **Type/Element selector (h1, div)** → targets specific HTML tags.

- **ID selector (#id)** → targets element with unique ID.
- **Class selector (.class)** → targets group of elements.
- **Group selector (h3, h4, .class)** → applies same style to multiple selectors.
- **Attribute selector ([attr], [attr=value])** → targets elements with specific attributes.
- **Descendant selector (div p)** → selects nested elements.
- **Child selector (div > p)** → selects direct children only.
- **Adjacent sibling (h2 + p)** → selects element immediately after another.
- **General sibling (h2 ~ p)** → selects all siblings after another element.

## 2. CSS Inclusion Methods

- **Inline** → inside HTML tag (style attribute).
- **Internal** → inside <style> tag in HTML.
- **External** → separate .css file linked with <link>.

## 3. CSS Background & Colors

- background-color → sets background color.
- color → sets text color.
- Supports named colors, hex (#333), RGB, HSL.

## Coding Round Questions

1. Write CSS to make all elements have a green background using the universal selector.
2. Style all <h1> elements with a yellow background.
3. Create a class .highlight that changes text color to red and apply it to multiple <p> tags.
4. Use an ID selector to make one heading have font size 50px.
5. Write CSS to style all <a> tags with target="\_blank" to have red text.
6. Use a descendant selector to make all <li> inside <ol> purple.
7. Use a child selector to style only direct <p> children of a <div>.

8. Demonstrate adjacent sibling selector by styling the <p> immediately after an <h2>.
9. Demonstrate general sibling selector by styling all <p> after an <h2>.
10. Link an external CSS file style.css to your HTML page.
